The Philosophy of Free Will in a Deterministic World

Do You Choose Your Choices — or Are They Chosen For You?

No. 07 of 30 | Critical Thinking Series

Awet G. Nway

Founder, AYE Tech Hub | Thinker, Educator & AI Researcher

- What free will means — and why the question matters more than you think
- Hard determinism: why physics might mean you never had a choice
- Three major positions: Hard Determinism, Libertarian Free Will, Compatibilism
- The Libet experiments — what neuroscience says about conscious decisions
- Compatibilism: the most defensible position and why philosophers prefer it
- Free will, moral responsibility, and the justice system
- What this means for your daily decisions and personal growth

You woke up this morning and made choices. You chose what to eat, what to wear, whether to read this. Or did you? What if every single one of those "decisions" was the inevitable result of the specific arrangement of atoms in your brain, which was itself the result of your genetics, your upbringing, what you ate yesterday, and ultimately the Big Bang 13.8 billion years ago? What if you never had a choice at all — not in any meaningful sense?

This is the free will problem — one of the oldest, most contested, and most consequential questions in all of philosophy. It matters not just intellectually but practically: your beliefs about free will determine how you judge yourself when you fail, how you judge others when they harm you, whether you believe criminals deserve punishment or only treatment, and whether personal responsibility is a meaningful concept or a useful fiction.

By the end of this lesson, you will understand the three major philosophical positions on free will, what neuroscience has added to the debate, and — most importantly — what the most defensible position means for how you live.

"Between stimulus and response there is a space. In that space is our power to choose our response."

— Viktor Frankl, Man's Search for Meaning (1946)

Defining the Terms — Free Will and Determinism

Before examining positions, we must define what we are arguing about. Both "free will" and "determinism" are used loosely in everyday speech — in philosophy, they have precise meanings.

Term	Philosophical Definition	Key Implication
Free Will	The capacity of an agent to choose and act in a way that is genuinely up to them — not simply the result of prior causes over which they had no control	If free will exists, you are the true author of your choices and therefore genuinely responsible for them
Determinism	The thesis that every event, including every mental event and decision, is the inevitable result of prior causes operating according to natural laws	If determinism is true, given the exact state of the universe at any moment, only one future is physically possible
Causal determinism	The specific claim that physical causation determines all events from the Big Bang forward — including what you "decide" to do right now	Your "decisions" are actually just the outputs of brain states determined by prior brain states, genetics, environment
Indeterminism	The thesis (supported by quantum mechanics) that some events are genuinely random — not fully determined by prior causes	Randomness does not obviously help free will — a random decision is not "freely chosen" any more than a determined one is
Moral responsibility	The condition of being appropriately held accountable for an action — deserving praise, blame, reward, or punishment	If free will is an illusion, moral responsibility — and the entire justice system — must be reconsidered

Compatibilism	The philosophical position that free will and determinism are both true and compatible — "free will" simply needs to be defined correctly	We can have the kind of freedom that matters morally without needing to escape the causal order of the universe
---------------	---	---

Three Major Positions on Free Will — The Philosophical Spectrum

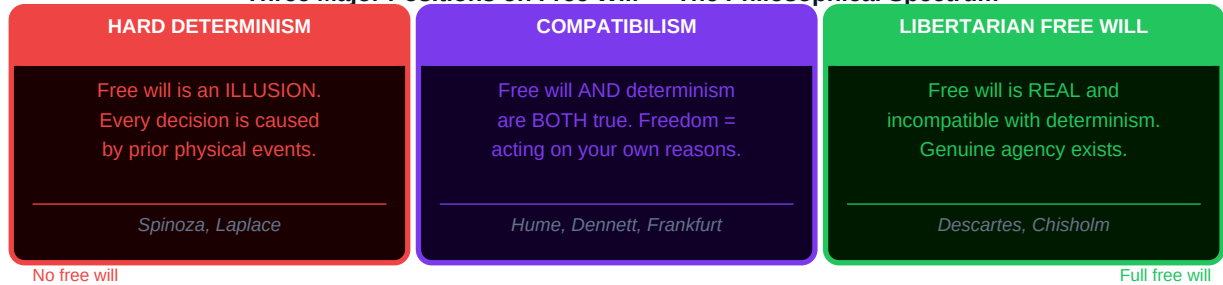

Fig 1 — ~59% of professional philosophers favour Compatibilism (PhilPapers Survey 2020)

Hard Determinism — The Case Against Free Will

Hard determinism is the position that (1) determinism is true and (2) free will is therefore impossible. Every action you take is the inevitable result of prior causes — your genetics, your upbringing, your brain chemistry at that exact moment — which were themselves the result of prior causes, stretching back to before you were born.

The 18th-century French mathematician **Pierre-Simon Laplace** gave the clearest expression of this view: imagine a being (later called "Laplace's Demon") that knows the exact position and momentum of every particle in the universe. That being could, in principle, calculate the entire future — including every "decision" you will ever make. If such calculation is possible in principle, your choices are no more free than a billiard ball's trajectory after being struck.

The Core Hard Determinist Argument

1. Every event has a prior cause (causal closure of the physical world).
2. Human decisions are events that occur in the physical world (in the brain).
3. Therefore, every human decision has a prior cause.
4. If a decision has a prior cause you did not control, you did not freely choose it.
5. Therefore: free will is impossible. All choices are illusions.

This argument is logically valid — if you accept premise 1 and 4, the conclusion follows. The question is whether premise 4 is the right definition of "free." Critics argue that hard determinists use an impossibly demanding definition of freedom — one that nothing in the universe, not even God, could satisfy.

The Neuroscience Evidence — The Libet Experiments

In 1983, neuroscientist **Benjamin Libet** conducted experiments that sent shockwaves through the free will debate. He asked subjects to flex their wrists whenever they felt like it, while measuring brain activity with EEG and tracking eye position on a clock to record when subjects first felt the "urge" to move.

The Libet Experiment (1983) — Timeline of a "Voluntary" Decision

KEY: Brain initiates movement 350ms BEFORE conscious awareness

Fig 2 — Libet (1983): unconscious brain activity precedes the conscious decision to move

The result was striking: the brain's "readiness potential" — a ramp-up in electrical activity associated with preparing to move — began approximately **550 milliseconds before the movement**. But subjects only became consciously aware of the urge to move about 200 milliseconds before the movement. The unconscious brain appeared to initiate the movement **350 milliseconds before the person was even conscious of deciding to move**.

Interpretation	What It Claims	Counter-Arguments
Hard Determinist view	Conscious will is an illusion — the brain decides before "you" do. The sense of choosing is a post-hoc rationalisation of a decision already made unconsciously.	The experiment tested only simple spontaneous wrist flexions — not complex deliberative decisions. Most important real choices involve extended conscious deliberation over minutes, hours, or days.
Compatibilist response	Conscious deliberation influences the unconscious processes that generate the readiness potential. The experiment did not eliminate conscious agency — it located it earlier in the process.	Libet himself noted subjects could veto the movement up to 150ms before it occurred — the "free won't" finding. Conscious vetoing is still a form of agency.
Later research (Soon et al. 2008)	Using fMRI, researchers predicted subjects' decisions up to 10 seconds before subjects were consciously aware of deciding. Predictive brain patterns were found in prefrontal and parietal cortex.	The prediction accuracy was only 60% — better than chance but far from certain. This leaves substantial room for genuine agency and is not full determinism.

The "Free Won't" Finding — Libet's Own Conclusion

Libet himself did not conclude that free will was impossible. He noted that subjects could consciously veto the movement after becoming aware of the urge but before the muscle fired. He proposed that conscious will might not initiate actions but can **BLOCK** or **MODIFY** them — what he called "free won't." This preserves a meaningful form of agency even if the brain initiates actions unconsciously.

Compatibilism — The Most Defensible Position

Compatibilism is the philosophical thesis that free will and determinism are not mutually exclusive — both can be true simultaneously. It is the most widely held position among professional philosophers (around 59% according to the 2020 PhilPapers survey). The key move is to redefine "free will" in a way that does not require escaping the causal order of the universe.

The compatibilist asks: what kind of freedom is actually worth wanting? The hard determinist demands freedom from causation itself — a metaphysically impossible standard. The compatibilist argues that what matters

morally is whether your action flows from **your own reasons, values, and deliberation** rather than from external compulsion, manipulation, or addiction.

Compatibilist Thinker	Core Argument	Key Concept
David Hume (1711–1776)	Liberty is simply "a power of acting or not acting according to the determinations of the will." Freedom means absence of external constraint — not absence of causation. Your desires causing your action is freedom, not unfreedom.	"Liberty" = acting according to your own desires without compulsion
Immanuel Kant (1724–1804)	Humans are subject to natural causation as physical beings (phenomenal self) but can also act according to rational principles they give themselves (noumenal self). Rational self-governance IS free will.	Autonomy = self-legislation by reason, not freedom from causation
John Stuart Mill (1806–1873)	A person is free if they can act as they choose, even if what they choose is determined. Compulsion (by others or by neurological disorder) is the threat to freedom — not determinism itself.	Freedom = acting on your own motives, not being forced by others
Daniel Dennett (born 1942)	Free will is a real phenomenon that evolved in humans — the capacity to deliberate, consider reasons, and respond to reasons. It is a complex biological achievement, not a metaphysical magic. "The kind of free will worth wanting" is fully compatible with determinism.	"Real patterns" of agency are real even in a deterministic universe
Harry Frankfurt (born 1929)	Free will requires being able to act on your "second-order desires" — desires about your desires. Addicts act on first-order desires (to use drugs) against their second-order desires (to not want drugs). Free will is hierarchical self-governance.	First-order vs second-order desires; wholeheartedness

The Compatibilist Definition of Free Will

You act freely when: (1) you act on your own reasons and values, (2) you are not compelled by force, addiction, manipulation, or mental illness that bypasses your rational agency, and (3) you could have done otherwise IF you had different desires or reasons. The word "if" is crucial — compatibilists say "could have done otherwise" means "would have done otherwise if the circumstances were different," not "could have done otherwise in the exact same physical universe."

Free Will, Moral Responsibility, and Justice

The most practically consequential aspect of the free will debate is its implication for moral responsibility and justice. If hard determinism is correct and people cannot help acting as they do — given their brain chemistry, genetics, and upbringing — then punishment for wrongdoing becomes morally problematic. You cannot justly punish someone for something they could not have avoided.

Position on Free Will	Implication for Justice	Approach to Criminal Justice
-----------------------	-------------------------	------------------------------

Hard Determinism	No one truly deserves punishment — all behaviour is caused by prior factors. Retributive punishment (punishing because they deserve it) is unjustified.	Justice system should focus only on prevention, incapacitation, and rehabilitation — never on desert-based punishment. Treat crime as a public health issue.
Libertarian Free Will	People genuinely could have chosen otherwise. Wrongdoers deserve punishment proportional to their crime. Retributive justice is fully justified.	Traditional criminal justice — punishment is deserved when freely chosen. Focus on culpability and desert. Less emphasis on mitigating circumstances.
Compatibilism	People who act from their own reasons without compulsion are responsible — even in a deterministic world. Degree of responsibility varies with degree of rational agency (addiction, mental illness, coercion reduce it).	Blended approach: punishment for deterrence and incapacitation; rehabilitation when rational agency was compromised; graduated responsibility based on agent's actual reasoning capacity at time of act.

IMPORTANT NUANCE — Even committed hard determinists do not advocate for eliminating all consequences for harmful behaviour. They argue that consequences are justified for their effects (deterrence, protection of others) rather than as desert. The practical difference from compatibilism is smaller than it seems — both support consequences, but for different reasons.

Classic Thought Experiments on Free Will

Thought Experiment	Setup	What It Tests	The Key Lesson
Laplace's Demon	An intellect that knows all forces and positions in the universe. Could it predict every future event — including all human decisions?	Whether determinism is true; whether the future is fixed in principle	Even if the demon could predict your choices, compatibilists say you are still "free" if your choices flow from your own reasons — predictability does not eliminate agency
Frankfurt Cases (Harry Frankfurt, 1969)	A neuroscientist implants a device that will intervene only if Jones decides NOT to vote for Smith. Jones decides to vote for Smith without being intervened on. Is Jones responsible?	Whether "could have done otherwise" is necessary for moral responsibility	Jones is responsible even though he could NOT have done otherwise — because he acted on his own reasons. This challenges the standard incompatibilist view of freedom.
The Experience Machine (Robert Nozick, 1974)	A machine gives you any experiences you want — perfectly happy, seemingly meaningful life. You cannot tell you are inside. Would you plug in?	Whether subjective experience is all that matters for a good life — related to the reality of agency	Most people refuse — suggesting we care about actually doing things, not just experiencing them. Real agency matters to us intrinsically.

The Manipulation Argument (Derk Pereboom)	A person is raised by scientists who shaped their character perfectly to commit a crime. Are they morally responsible if they later commit it?	Whether compatibility with determinism is enough for responsibility if the causal history involves manipulation	Challenges compatibilism by suggesting that the SOURCE of our reasons (genes/upbringing) matters, not just whether we act on our own reasons
Strawson's Reactive Attitudes (P.F. Strawson, 1962)	We naturally feel gratitude, resentment, indignation, and love in response to others. These "reactive attitudes" form the foundation of moral responsibility.	Whether our practice of holding people responsible is justified even if determinism is true	Strawson argues the practice of reactive attitudes is constitutive of human relationships — it does not require metaphysical free will to be rational or valuable

What This Means for How You Live — Practical Implications

This is not merely an academic debate. Your implicit beliefs about free will — whether you hold them consciously or not — shape how you respond to your own failures, how you judge others, and whether you believe in personal growth.

Life Domain	Hard Determinist Implication	Compatibilist Implication
Self-blame for failures	"I could not have done otherwise — my brain chemistry made it inevitable." Risk: removes motivation to change.	"My reasons and habits led here. I can develop new habits, values, and deliberative skills — my agency is real even if caused."
Judging others who harm you	"They could not have helped it — blame is irrational." Risk: removes boundaries; enables harmful people.	"They acted from their own reasons without coercion — they are appropriately held responsible, even if shaped by causes."
Personal development	"Change is just another determined outcome — effort is determined too." Risk: fatalism masquerading as insight.	"I can deliberately cultivate reasons, values, and habits that influence my future behaviour — this is what growth IS."
Moral praise and gratitude	"Gratitude makes no sense — the kind act was determined." Risk: hollows out human relationships.	"Gratitude responds to the person's values and character — which are genuinely theirs even if caused. Gratitude is appropriate."
Responding to your own bad habits	"I am determined to have this habit." Risk: passivity and self-indulgence.	"My habit is shaped by causes, but I have the capacity to introduce new reasons and strengthen new patterns — this is agency."
The meaning of achievement	"My success was determined — I deserve no credit." Risk: deflates motivation and pride.	"My achievements reflect my values, effort, and reasoning — genuinely mine even if caused. Pride and credit are appropriate."

The Practical Case for Compatibilism

Hard determinism, taken seriously, is psychologically corrosive. Research by Kathleen Vohs and Jonathan Schooler (2008) showed that participants induced to believe free will is an illusion cheated more and helped others less — even after brief exposure to hard determinist texts. The belief that you have genuine agency appears to support prosocial behaviour and self-regulation. Compatibilism gives us the metaphysically honest middle ground: free will is real, defined correctly — as acting on your own reasons without coercion — even in a deterministic universe.

Key Thinkers — A Reference Card

Philosopher	Position	Era	Key Contribution to Free Will Debate
Baruch Spinoza	Hard Determinist	1632–1677	All things follow necessarily from God/Nature. Human free will is an illusion born of ignorance of causes. Only intellectual understanding brings a kind of liberation.
David Hume	Compatibilist	1711–1776	First systematic compatibilism. Freedom = acting on desires without external compulsion. Causation of actions by motives is what makes them OUR actions.
Immanuel Kant	Libertarian / Compatibilist	1724–1804	Phenomenal self is determined; noumenal self (as rational agent) is free. Transcendental idealism attempts to preserve both science and morality.
William James	Libertarian	1842–1910	Argued for genuine indeterminism; our choices introduce real novelty into the universe. Championed the moral significance of genuine alternatives.
P.F. Strawson	Compatibilist	1919–2006	"Freedom and Resentment" (1962): grounds moral responsibility in our natural reactive attitudes (resentment, gratitude, love) rather than metaphysics.
Harry Frankfurt	Compatibilist	born 1929	Free will as higher-order volition: you are free when your first-order desire aligns with your second-order desire about what to desire.
Daniel Dennett	Compatibilist	born 1942	"Elbow Room" and "Freedom Evolves": free will is a real biological and cognitive achievement — the capacity to respond to reasons. Fully compatible with determinism.
Derk Pereboom	Hard Incompatibilist	born 1957	Argues compatibilist definitions fail; but also argues hard determinism does not destroy ethics — we can still hold forward-looking practices of responsibility.

Key Takeaways — CT-007: Free Will in a Deterministic World

- **Free will and determinism are not obviously contradictory** — the real question is what "free will" means. The compatibilist definition (acting on your own reasons without coercion) is the most defensible.
- **Hard determinism follows logically** from certain premises — but premise 4 (that causation eliminates freedom) is not self-evident and is rejected by most professional philosophers.
- **The Libet experiments are striking but limited** — they apply to simple spontaneous actions, not deliberative decisions. The "free won't" finding preserves significant conscious agency.
- **Compatibilism (Hume, Dennett, Frankfurt) is the majority view** among philosophers because it captures what actually matters morally — acting from your own values and reasons — without requiring an impossible

escape from causation.

- **Your beliefs about free will have real consequences** — research shows that free will denial increases antisocial behaviour and reduces self-regulation. How you understand agency shapes how you act.
- **Moral responsibility survives compatibilism** — people who act from their own uncoerced reasons are appropriately held responsible, even in a deterministic world. The justice system is compatible with this view.
- **Next lesson — CT-008: Epistemology** — How Do We Know What We Know? We examine the foundations of knowledge, justified belief, and the limits of certainty.
