Macros Made Simple

Day 5 of 30 | Nutrition

Awet G. Nway

Mechanical Engineer & Fitness Coach

- Protein, carbs & fat explained
- Calorie targets by goal
- Daily meal template

01 | Why Nutrition Is 70% of Your Results

You can train every single day and see almost no change in your body composition if your nutrition is wrong. Exercise burns calories; nutrition determines whether your body uses fat or muscle for fuel, whether it builds new muscle, and how quickly it recovers. You cannot out-train a bad diet — but you can eat your way to results even with moderate training.

The good news: you do not need a complicated diet. You need to understand three numbers — your three macronutrients. Everything else is detail.

■ INFO — Calorie Is a Unit of Energy

1 calorie = the energy needed to raise 1g of water by 1°C. Your body runs on calories like a car runs on fuel. Too little fuel → it burns muscle. Too much → it stores fat. The goal is to give it exactly the right amount for your specific goal.

02 | The Three Macronutrients

Macro	Calories/gram	Primary Role	Best Sources
Protein	4 kcal/g	Build & repair muscle. Most important macro for body composition.	Eggs, chicken, beef, lentils, Greek yogurt, cottage cheese
Carbohydrates	4 kcal/g	Primary fuel for brain and high-intensity exercise. Not stored in large amounts.	Rice, oats, sweet potato, banana, bread, pasta, berries
Fat	9 kcal/g	Hormone production, joint health, fat-soluble vitamin absorption.	Avocado, olive oil, nuts, seeds, fatty fish, eggs

■■ WARNING — Fat Does Not Make You Fat

Dietary fat does not directly become body fat. Excess calories from ANY macro cause fat gain. Fat has 9 kcal/g (vs 4 for protein/carbs) so it is calorie-dense — be mindful of portion size, but do not eliminate it. Healthy fats are essential.

03 | How Many Calories Do You Need?

Start with your **TDEE** — Total Daily Energy Expenditure. This is the total calories your body burns in a day including activity. Use the table below as a starting estimate, then adjust based on results after 2 weeks.

Goal	Daily Calories (estimate)	Protein Target	Adjust If...
Lose fat	TDEE – 300 to –500 kcal	2.0–2.2g per kg bodyweight	Not losing after 2 wks → cut 100–200 more kcal
Maintain weight	= TDEE	1.6–2.0g per kg bodyweight	Weight drifting up or down → adjust by ±100 kcal
Build muscle	TDEE + 200 to +350 kcal	1.8–2.2g per kg bodyweight	Gaining too much fat → reduce surplus to +150 kcal

■ INFO — Quick TDEE Estimate

Multiply your bodyweight in kg by: 28–30 (sedentary / desk job, little exercise) | 32–35 (lightly active, 3–4 workouts/week) | 37–40 (very active, physical job or 5+ workouts/week). Example: 75 kg, lightly active → 75 × 33 = ~2,475 kcal/day TDEE.

04 | Protein — The Most Important Macro

Protein is the only macro that directly builds and repairs muscle tissue. If you do one thing from this lesson, make it hitting your protein target every day. Everything else is secondary.

Bodyweight	Fat Loss Target (2.2g/kg)	Muscle Gain Target (2.0g/kg)	Daily Protein Foods Example
55 kg	121 g protein/day	110 g protein/day	3 eggs + 150g chicken + 200g Greek yogurt + 100g lentils
70 kg	154 g protein/day	140 g protein/day	3 eggs + 200g chicken + 250g Greek yogurt + 150g cottage cheese
85 kg	187 g protein/day	170 g protein/day	4 eggs + 250g fish + 300g Greek yogurt + 200g lentils
100 kg	220 g protein/day	200 g protein/day	5 eggs + 300g chicken + 300g Greek yogurt + 200g cottage cheese

■ TIP — Spread Protein Across Meals

Your body can only use ~35–40g of protein per meal for muscle synthesis. Eating 150g in one sitting wastes the excess. Aim for 4–5 meals with 30–40g protein each — breakfast, lunch, snack, dinner, post-workout.

05 | Simple Daily Meal Template

You do not need to count every calorie to get results. Use this plate-based template and you will be close enough for real progress.

Meal	What to Include	Rough Portion
Breakfast	Protein + complex carb + healthy fat	3 eggs + oats + handful of nuts OR Greek yogurt + banana + seeds
Lunch	Protein + vegetables + carb (moderate)	Chicken/fish (palm-size) + large salad + ½ cup rice
Snack	Protein + fruit or vegetable	Cottage cheese + apple OR boiled eggs + carrots
Dinner	Protein + vegetables + small carb	Fish/beef (palm-size) + 2 cups vegetables + small potato
Post-workout	Fast protein within 30–45 min	Greek yogurt OR protein shake OR 3 boiled eggs

■ INFO — The Plate Method (No Counting)

½ plate vegetables | ¼ plate protein | ¼ plate complex carbs | thumb-size healthy fat. Use this at every meal and you will naturally hit the right macro ratios without tracking a single number.

06 | Nutrition Quick Reference

Rule	What to Do
Protein first	Build every meal around a protein source. Then add carbs and fat.
Eat whole foods 80% of time	If it comes from the ground or had a face, it counts. Minimise packaged food.
Do not fear carbs	Carbs fuel your workouts. Eat most of them around training time.
Hydration	Drink 35ml per kg bodyweight daily. Urine should be pale yellow.
Consistency beats perfection	6 good days + 1 imperfect day beats 1 perfect day + 6 bad ones.
Do not skip breakfast	Skipping breakfast leads to overeating later. Protein in the morning controls hunger.
Alcohol	Alcohol is 7 kcal/g, stops fat burning for 24–48 hrs, disrupts sleep and recovery.

07 | Day 5 Daily Action

Today has no workout — this is your nutrition planning day. Complete both actions below before Day 6.

Action	Task	Done?
Action 1	Calculate your estimated TDEE using the formula above. Write it below.	■
Action 2	Plan tomorrow's meals using the plate method template. Write them below.	■

My TDEE estimate: _____ kcal/day My goal: ■ Fat loss ■ Maintain ■ Build muscle

My protein target: _____ g/day My bodyweight: _____ kg

08 | Day 5 Self-Check Question

"Looking at what you normally eat in a day — are you getting enough protein? What is the ONE food swap you could make this week to increase your protein intake without feeling deprived?"

Your answer:

Next up — Day 6:
The Mindset Shift — From Wanting to Doing
